Conic optimization

Conic quadratic optimization

Applications

Summary

References

Exercises

- A software package.
- Solves large-scale sparse optimization problems.
- Handles **linear**, **conic**, and **nonlinear** convex problems.
- Stand-alone as well as embedded.
- Used to solve problems with up to millions of constraints and variables.
- Version 1 release in 1999.
- Version 5 released summer 2007.

For details about interfaces, trials, etc. see

<http://www.mosek.com>.

Motivation for conic optimization

Introduction

Motivation for conic optimization

Applications

Summary

References

Exercises

$$\begin{array}{ll} (P) & \min \quad c^T x \\ & \text{st} \quad Ax = b, \\ & \quad \quad x \geq 0. \end{array}$$

Pros:

- Huge number applications.
- Powerful theory associated e.g. Farkas' lemma and duality.
- Highly efficient algorithms exists (simplex and interior-point).
- Easy to represent the problem using c , A , and b .
- Several solver software packages are available e.g. MOSEK, CPLEX, Xpress.
- Several modeling software packages are available e.g. GAMS, AMPL, AIMMS.
- In short: Linear optimization is easy to use.

Introduction

Motivation for conic optimization

A detour around linear optimization

Conic optimization

Conic quadratic optimization

Applications

Summary

References

Exercises

Cons:

- The linearity assumption is restrictive.
- For instance the unit ball

$$x_1^2 + x_2^2 \leq 1$$

can only be approximated.

Question:

- Is it possible to generalize linear optimization while keeping all the good properties?

[Introduction](#)

[Summary](#)

[References](#)

[Exercises](#)

$$\begin{array}{ll} (NO) & \min f(x) \\ & \text{st} \quad g(x) \leq 0. \end{array}$$

Pros:

- Very general.

Cons:

- Duality theory is somewhat fuzzy.
- Lack of good algorithms.
- Local versus global optimums.
- Convexity (how to check).
- Black box model.
- How to compute gradients and Hessians.
- How to handle f and g in software.

Motivation for conic optimization

A detour around linear optimization

Conic optimization

Conic quadratic optimization

Applications

Summary

References

Exercises

The linear optimization problem involves the convex cone

$$\{x \in \mathcal{R} : x \geq 0\}$$

denoted the *linear cone*.

Recall a **convex** set \mathcal{K} is a convex cone if

$$x \in \mathcal{K} \Rightarrow \lambda x \in \mathcal{K}, \forall \lambda \geq 0.$$

A generalization of linear optimization is to allow more general cones i.e the *quadratic cone*:

$$\left\{ x \in \mathcal{R}^n : x_1 \geq \sqrt{\sum_{j=2}^n x_j^2} \right\}$$

Introduction

Motivation for conic optimization

A detour around linear optimization

Conic optimization

Conic quadratic optimization

Applications

Summary

References

Exercises

The quadratic cone is also known as

- The second order cone.
- The Lorentz cone.
- The ice cream cone.

An example:

$$\begin{array}{ll} \min & x_5 \\ \text{st} & 2x_1 + 3x_2 - 1 = x_3, \\ & 1x_1 + 7x_2 - 2 = x_4, \\ & x_5 \geq \sqrt{x_3^2 + x_4^2}. \end{array}$$

Equivalent specifications:

- $\left\{ x \in \mathcal{R}^n : x_1 \geq \sqrt{\sum_{j=2}^n x_j^2} \right\}$
- $\{x \in \mathcal{R}^n : x_1 \geq \|x_{2:n}\|\}$
- $\left\{ x \in \mathcal{R}^n : x_1^2 \geq \sum_{j=2}^n x_j^2, x_1 \geq 0 \right\}$
- $\{x \in \mathcal{R}^n : x \succeq_Q 0\}$

Notes:

- All norms are 2 norms unless otherwise stated.
- Conic optimization may be seen as a way of generalizing the inequality (\geq).
- Many applications will be shown later.

The generic conic optimization problem:

$$\begin{array}{ll} \min & \sum_k (c^k)^T x^k \\ \text{st} & \sum_k A^k x^k = b, \\ & x^k \in \mathcal{K}^k. \end{array}$$

where

- $c^k \in \mathcal{R}^{n^k}$.
- $A^k \in \mathcal{R}^{m \times n^k}$.
- $b \in \mathcal{R}^m$.
- \mathcal{K}^k is a nonempty pointed convex cone i.e.
 - ◆ (Convexity) \mathcal{K}^k is a convex set.
 - ◆ (Conic) $x \in \mathcal{K}^k \Rightarrow \lambda x \in \mathcal{K}^k, \forall \lambda \geq 0$.
 - ◆ (Pointed) $x \in \mathcal{K}^k$ and $-x \in \mathcal{K}^k \Rightarrow x = 0$.

Well-known facts:

- (1) has an optimal solution if and only if a solution (x, y, s) exist such that

$$\begin{aligned} Ax &= b, & x &\geq 0, \\ A^T y + s &= c, & s &\geq 0, \\ c^T x - b^T y &= 0. \end{aligned}$$

- (1) is primal infeasible if and only a (y, s) exists such that

$$A^T y + s = 0, \quad b^T y > 0, \quad s \geq 0.$$

- (1) is dual infeasible (i.e. (2) is infeasible) if and only a x exists such that

$$Ax = 0, \quad c^T x < 0, \quad x \geq 0.$$

Exercises

Given a convex cone \mathcal{K} then the dual cone \mathcal{K}^* is given by

$$\mathcal{K}^* := \{s : s^T x \geq 0, \forall x \in \mathcal{K}\}.$$

Given the primal conic optimization

$$\begin{array}{ll} \min & \sum_k (c^k)^T x^k \\ \text{st} & \sum_k A^k x^k = b, \\ & x^k \in \mathcal{K}^k. \end{array} \quad (3)$$

then the corresponding dual problem is

$$\begin{array}{ll} \max & b^T y \\ \text{st} & (A^k)^T y + s^k = c^k, \\ & s^k \in (\mathcal{K}^k)^*. \end{array} \quad (4)$$

[Introduction](#)

[Summary](#)

[References](#)

[Exercises](#)

Observe the dual cone corresponding to the linear cone

$$\{x \in \mathcal{R} : x \geq 0\}$$

is

$$\{s \in \mathcal{R} : s \geq 0\}.$$

- The linear cone is self-dual i.e.

$$\mathcal{K} = \mathcal{K}^*.$$

- In the linear case conic duality is equivalent to the usual linear optimization duality.

[Introduction](#)

[Motivation for conic optimization](#)

[Conic optimization](#)

[A recap. of linear duality](#)

[Weak duality](#)

[Strong duality](#)

[Conic duality](#)

[Conic quadratic optimization](#)

[Applications](#)

[Summary](#)

[References](#)

[Exercises](#)

Observe

- Weak duality holds:

$$\begin{aligned}\sum_k (c^k)^T x^k - b^T y &= \sum_k ((A^k)^T y + s^k)^T x^k - b^T y \\ &= b^T y + \sum_k (x^k)^T s^k - b^T y \\ &= \sum_k (x^k)^T s^k \\ &\geq 0.\end{aligned}$$

- All the usual duality relations holds **ALMOST** in the conic case.
- More details later.

Exercises

- Conic optimization is a way to generalize linear optimization.
- The nonlinearity is placed in the cone.
- Hence, a way of generalizing what is meant by inequality.
- A conic problem has a meaningful dual problem just as in the linear case.
- The problem is completely specified by c , A , and b plus some simple information about the cone structure.
- Hence, conic optimization is almost like linear optimization.

Conic quadratic optimization

Exercises

Consider the set

$$\frac{1}{2} \|x\|^2 + f^T x \leq g$$

which is equivalent to

$$\begin{aligned} z + f^T x &= g, \\ y &= 1, \\ \|x\|^2 &\leq 2zy, \quad z, y \geq 0. \end{aligned}$$

Next define

$$z = \frac{u+v}{\sqrt{2}} \text{ and } y = \frac{u-v}{\sqrt{2}}.$$

This implies

$$\begin{aligned} 2zy &= \frac{u+v}{\sqrt{2}} \frac{u-v}{\sqrt{2}} \\ &= u^2 - v^2. \end{aligned}$$

[Introduction](#)

[Conic optimization](#)

[Conic quadratic optimization](#)

[A few facts](#)

[The rotated quadratic cone](#)

[Applications](#)

[Summary](#)

[References](#)

[Exercises](#)

Hence we obtain

$$\begin{aligned}\frac{u+v}{\sqrt{2}} + f^T x &= g, \\ \frac{u-v}{\sqrt{2}} &= 1, \\ \|x\|^2 + v^2 &\leq u^2, \quad u \geq 0.\end{aligned}$$

Clearly,

$$\|x\|^2 + v^2 \leq u^2, \quad u \geq 0.$$

is the standard quadratic cone.

Introduction

Motivation for conic optimization

Exercises

Comments:

■ The set

$$\left\{ x \in \mathcal{R}^n : 2x_1x_2 \geq \sum_{j=3}^n x_j^2, x_1, x_2 \geq 0 \right\}$$

is called the rotated quadratic cone.

- The rotated quadratic cone is identical to the quadratic cone under a linear transformation.
- Implies we can use the rotated quadratic whenever we like.

Applications

- Introduction
- Motivation for conic optimization

Exercises

1: Convexity

1. Assume $f(x)$ is a twice differentiable convex function. What holds about the Hessian?
2. Given the function

$$f(x) = 0.5x^T Hx + c^T x + b$$

then specify under which conditions on H , v and b

- The set $\{x : f(x) = 0\}$ is convex.
- The set $\{x : f(x) \leq 0\}$ is convex.
- The set $\{x : f(x) \geq 0\}$ is convex.
